

2.5 Judith Lessler: Leveraging Existing Data

<p>Leveraging Existing Data</p> <p>Can the cost of surveys be reduced by making better use of existing administrative and survey data?</p> <p>Can we create an integrated methodology for use of primary and secondary data?</p> <p>Chatham Research Consultancy, LLC 1</p>	<p>Basic Situation: Resources</p> <ul style="list-style-type: none"> • Numerous surveys are conducted; many public use files available • Administrative and geographic data are available • Improved tools exist for using secondary data; data mining, metadata, data warehouses • Ontologies and metadata standards <p>Chatham Research Consultancy, LLC 2</p>
<p>Basic Situation: Resources</p> <ul style="list-style-type: none"> • Data archives: <ul style="list-style-type: none"> • ICPSR: Interuniversity Consortium for Political and Social Research • SAMDA: Substance Abuse and Mental Health Data Archive • StatLib: JASA data archive • FedStats: Links to multiple statistical agency resources <p>Chatham Research Consultancy, LLC 3</p>	<p>Basic Situation: Resources</p> <ul style="list-style-type: none"> • Administrative/Geographic Data <ul style="list-style-type: none"> • Census data • Data from government programs: Medicare, SSA, Food Stamps, WIC, National Spatial Data Infrastructure • Administrative/survey data: IPEDS-Integrated Postsecondary Education Data System <p>Chatham Research Consultancy, LLC 4</p>
<p>Basic Situation: Deficiencies</p> <ul style="list-style-type: none"> • New surveys conducted without sufficient consideration of what is known • Lack of micro-data and metadata from published studies/surveys • Tendency to investigate many research questions [high burden] <p>Chatham Research Consultancy, LLC 5</p>	<p>Basic Situation: Needs</p> <ul style="list-style-type: none"> • Integrated methodology for primary and secondary data [IMPSD] <p>Chatham Research Consultancy, LLC 6</p>
<p>Integrated Methodology</p> <ul style="list-style-type: none"> • Clearer specification of the research questions—needed precision and definition of parameters • Policy decisions that need to be made with specification of what differences would yield different decisions • Needs of stakeholders: businesses, state and local agencies, educators, public <p>Chatham Research Consultancy, LLC 7</p>	<p>Integrated Methodology</p> <ul style="list-style-type: none"> • Analysis of secondary data: <ul style="list-style-type: none"> • Meta-analysis of the micro-data from public use files • Small-area (small domain) estimation using universe data from administrative or census records • Specification of remaining questions • Design of primary data collection to “fill in the blanks” • Design of administrative system for data aggregation and integration <p>Chatham Research Consultancy, LLC 8</p>

Initial Data Analysis

- Set of common variables—basic demographics
- Creation of analysis variables that create more overlap—categorical variables for quantitative data
- Modeling (imputation) for blocks of missing data

Chatham Research Consultancy, LLC9

Initial Data Analysis

Survey	Set A	Set B	Set C	Set D	Set E
1					
2

Chatham Research Consultancy, LLC11

Assess Needs for Primary Data

- More precision needed for some sets of variables
- Confirm modeled relationships between sets of variables
- Increase representation of subgroups

Chatham Research Consultancy, LLC12

Optimum Design

- What is most cost-effective design for obtaining additional information
 - Supplemental data collections using follow-up surveys
 - New survey of selected subgroups
 - Analysis of existing administrative data

Chatham Research Consultancy, LLC13

Needed Infrastructure

- Alignment of operational definitions of some basic variables across surveys
- Universal adoption of NIH data sharing policy for all government sponsored surveys
- Software that facilitates data integration

Chatham Research Consultancy, LLC14

NIH Data Sharing Plan

- Publishing
- Distribution of data by researcher
- Data enclave [secure environment]
- Data archive
- Mixed mode

Chatham Research Consultancy, LLC15

NIH Data Sharing Plan

- Schedule for data sharing
- Format of final data set
- Documentation to be provided
- Provision of analytic tools, if any
- Need for sharing agreement
- Mode of data sharing

Chatham Research Consultancy, LLC16

IMPSD Summary

- Specification of questions and quality parameters
- Meta-analysis of existing survey and administrative data
- Design of primary data collection to supplement or confirm conclusions from secondary data analysis
- Required provision of survey results to other researchers
- Data integration software

Chatham Research Consultancy, LLC17

Implementation of IMPSD

- Advantages of such an approach
- Disadvantages
- Barriers
- Facilitators

Chatham Research Consultancy, LLC18

2.6 Alan Karr: Principled Cost-Quality Tradeoffs

NISS

Principled Cost-Quality Tradeoffs

Alan F. Karr
National Institute of Statistical Sciences
karr@niss.org
April 19, 2006

Outline: Simple to Not-So-Simple

- Analytical approaches
 - Deterministic case
 - Discrete case
 - Parametric case
 - Stochastic case
- Modeling approaches: a sketch
- Some ugly questions
- DISCUSSION

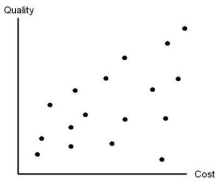

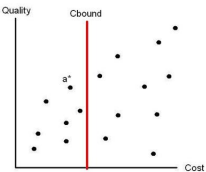

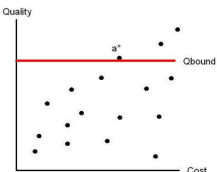

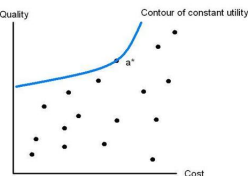

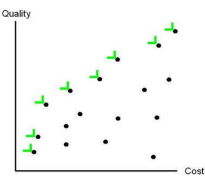

Big Questions

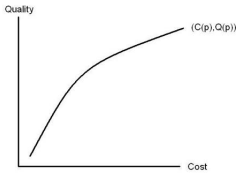

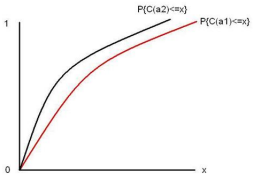

- What is cost?
 - Out-of-pocket
 - Opportunity
 - Time (?)
 - To whom?
- What is quality?
 - Accuracy
 - Timeliness
 - Response rate
 - Accessibility, relevance, coherence, interpretability, ...

Reference: A. F. Karr, D. L. Banks, A. P. Sanil (2006). Data quality: A statistical perspective. *Statistical Methodology* 3(2) 137-173.

-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	-------

<p style="text-align: center;">Deterministic Case</p> <ul style="list-style-type: none"> • Formulation <ul style="list-style-type: none"> – Actions a <ul style="list-style-type: none"> • Actions may have very complex structure • May be many actions • Discrete case: finite, not necessarily structured set of actions • Parametric case: actions qualitatively identical, but depend on some parameter, such as sample size – Known costs $C(a)$ <ul style="list-style-type: none"> • Initially, one-dimensional – Known resulting data qualities $Q(a)$ <ul style="list-style-type: none"> • Initially, one dimensional 	<p style="text-align: center;">Discrete Case</p>  <p>A scatter plot with 'Quality' on the vertical axis and 'Cost' on the horizontal axis. It shows a collection of discrete points representing different actions, with no connecting lines between them.</p>
<p style="text-align: center;">Optimization Approaches</p> <ul style="list-style-type: none"> • Maximize quality subject to upper bound on cost $a^* = \arg \max_a Q(a)$ $\text{s.t. } C(a) \leq C_{\text{bound}}$ • Minimize cost subject to lower bound on quality $a^* = \arg \min_a C(a)$ $\text{s.t. } Q(a) \geq Q_{\text{bound}}$ 	<p style="text-align: center;">Optimization Approaches—2</p> <ul style="list-style-type: none"> • Maximize utility: given utility function $U(c,q)$, $a^* = \arg \max_a U(C(a), Q(a))$
<p style="text-align: center;">Maximizing Quality s.t. Cost Bound</p>  <p>A scatter plot with 'Quality' on the vertical axis and 'Cost' on the horizontal axis. A vertical red line labeled 'Cbound' is drawn. A point labeled 'a*' is marked on the frontier of the data points to the left of the Cbound line.</p>	<p style="text-align: center;">Minimizing Cost s.t. Quality Bound</p>  <p>A scatter plot with 'Quality' on the vertical axis and 'Cost' on the horizontal axis. A horizontal red line labeled 'Qbound' is drawn. A point labeled 'a*' is marked on the frontier of the data points above the Qbound line.</p>
<p style="text-align: center;">Maximizing Utility</p>  <p>A scatter plot with 'Quality' on the vertical axis and 'Cost' on the horizontal axis. A blue curve labeled 'Contour of constant utility' is shown, passing through a point labeled 'a*' on the frontier of the data points.</p>	<p style="text-align: center;">The Cost-Quality Frontier</p>  <p>A scatter plot with 'Quality' on the vertical axis and 'Cost' on the horizontal axis. The points are connected by green line segments, forming a step-like 'frontier' that represents the set of non-dominated actions.</p>
<p style="text-align: center;">Computational Considerations</p> <ul style="list-style-type: none"> • Can “always” restrict to frontier: actions a for which there is no a' such that $C(a') \leq C(a)$ and $Q(a') \geq Q(a)$ <ul style="list-style-type: none"> – This may help a lot – There are efficient algorithms for calculating the frontier • Maximizing quality subject to cost bound and minimizing cost subject to quality bound may be solvable only by enumeration • Utility maximization solvable by bisection search, but this is still effectively enumeration • Size of problem = size of frontier 	<p style="text-align: center;">Other Computational Technologies</p> <ul style="list-style-type: none"> • Simulated annealing <ul style="list-style-type: none"> – Requires some concept of “neighboring” actions • Genetic algorithms <ul style="list-style-type: none"> – Requires that actions have “separable” components

<p style="text-align: center;">“Parametric” Case</p> <ul style="list-style-type: none"> • Actions are parametrized by a (numerical) parameter p <ul style="list-style-type: none"> – Example: parameter = sample size • Then <ul style="list-style-type: none"> – $a = a(p)$ – $C(p) = C(a(p))$ – $Q(p) = Q(a(p))$ • Everything else is more or less the same 	<p style="text-align: center;">Pictorial View</p> 
<p style="text-align: center;">Multi-dimensional Cost and Quality</p> <ul style="list-style-type: none"> • Frontier carries over: set of actions is partially ordered by $a_1 \preceq a_2$ if and only if <ul style="list-style-type: none"> • $C_j(a_2) \leq C_j(a_1)$ for all cost measures C_j • $Q_k(a_2) \geq Q_k(a_1)$ for all quality measures Q_k • Problem: with lots of dimensions, the frontier is not necessarily “small” • Utility functions not clear 	<p style="text-align: center;">Stochastic Costs and Quality</p> <ul style="list-style-type: none"> • Formulation <ul style="list-style-type: none"> – Given a, $C(a)$ and $Q(a)$ are (dependent!) random variables with distribution $F_a(x, y)$ • Issues <ul style="list-style-type: none"> – How much of the deterministic framework carries over? – From data are the F_a estimated? Or are they based on expert opinion? Or some combination? – How are uncertainties in the estimated F_a to be incorporated in the framework?
<p style="text-align: center;">“Elementary” Approaches</p> <ul style="list-style-type: none"> • Use only means <ul style="list-style-type: none"> – $C(a) = E[C(a)]$ – $Q(a) = E[Q(a)]$ • Combine means and standard deviations. Example: $C'(a) = E[C(a)] + \lambda \text{StdDev}(C(a))$ $Q'(a) = E[Q(a)] - \mu \text{StdDev}(Q(a))$ 	<p style="text-align: center;">Not Quite So Elementary Approaches</p> <ul style="list-style-type: none"> • Use means and standard deviations to define the partial order $a_1 \preceq a_2$ if and only if $E[C(a_2)] \leq E[C(a_1)]$ $\text{StdDev}(C(a_2)) \leq \text{StdDev}(C(a_1))$ $E[Q(a_2)] \geq E[Q(a_1)]$ $\text{StdDev}(Q(a_2)) \leq \text{StdDev}(Q(a_1))$ • Related approaches in the portfolio analysis literature
<p style="text-align: center;">More Complicated Approaches</p> <ul style="list-style-type: none"> • Use stochastic ordering to define the partial order. For example, $a_1 \preceq a_2$ if and only if $P\{C(a_2) \leq x\} \geq P\{C(a_1) \leq x\} \text{ for all } x$ $P\{Q(a_1) \leq y\} \leq P\{Q(a_2) \leq y\} \text{ for all } y$ • Lots of applications in the literature <ul style="list-style-type: none"> – Example: Reliability 	<p style="text-align: center;">Pictorial View of Stochastic Ordering</p> 
<p style="text-align: center;">What About Optimization?</p> <ul style="list-style-type: none"> • Constraints: replace by probabilistic versions: $P\{C(a) \leq C_{\text{bound}}\} \geq p_C$ $P\{Q(a) \geq Q_{\text{bound}}\} \geq p_Q$ • Utility functions: ????? <ul style="list-style-type: none"> – One approach: derive from loss functions using concepts from statistical decision theory 	<p style="text-align: center;">Back to the Really Hard Questions</p> <ul style="list-style-type: none"> • From data are the F_a estimated? Or are they based on expert opinion? Or a combination? • How are uncertainties in the estimated F_a to be incorporated in the framework? <ul style="list-style-type: none"> – Bayesian methods can account for this • Are there other implications? <ul style="list-style-type: none"> – Example: confidentiality • Temporal evolution of surveys

<p style="text-align: center;">Dynamics</p> <ul style="list-style-type: none"> • Formulation is inherently stochastic: <ul style="list-style-type: none"> – At time t, given a, $C_t(a)$ and $Q_t(a)$ are (dependent!) random variables with distribution $F_a(t, x, y)$ that reflects all information available at t • Issues <ul style="list-style-type: none"> – Ongoing incorporation of information: Bayesian techniques can do this, but need a model for that information – Interventions seem very problematic to model analytically 	<p style="text-align: center;">Problems with the Analytical Approach</p> <ul style="list-style-type: none"> • Getting hopelessly complicated, especially once dynamics are present • Sensitivity analyses hard • Disconnected from the science, therefore limited insight <ul style="list-style-type: none"> – Example: if a involves adaptive increase in sampling or follow-up, a la Groves, how does this get represented in F_a? – Example: not clear how to differentiate different kinds of surveys (e.g., drug use vs. educational experience) or populations
<p style="text-align: center;">What About a Modeling Approach?</p> <ul style="list-style-type: none"> • Technological basis: agent-based simulation: <ul style="list-style-type: none"> – Represent agents (e.g., interviewers and respondents) explicitly – Specify agent-level behavior and interactions – Specify “context” and “interventions” • Key {point/hope/blind faith}s <ul style="list-style-type: none"> – Context and interventions are fairly literal – Sensible models of agent produce “correct” emergent, macroscopic behavior • Variability characterized via replication of simulations 	<p style="text-align: center;">Example: TRANSIMS (LANL)</p> <ul style="list-style-type: none"> • Metro-area simulator of traffic <ul style="list-style-type: none"> – Context: <ul style="list-style-type: none"> • Population (synthesized from Census PUMS) • Activities (synthesized from survey) • Geography: Locations of houses, businesses, ..., road network – Interventions <ul style="list-style-type: none"> • Signal settings, ... • TRANSIMS models traffic “realistically” based on simple car-following rules <ul style="list-style-type: none"> – Example: speed up if there is enough space between you and the car in front of you
<p style="text-align: center;">What Would It Mean for Surveys?</p> <ul style="list-style-type: none"> • Set of abstractions <ul style="list-style-type: none"> – Agents <ul style="list-style-type: none"> • Respondents • Interviewers – Responses <ul style="list-style-type: none"> • Cost • Quality – Interventions <ul style="list-style-type: none"> • Increase incentives • Increase intensity of non-respondent follow-up 	<p style="text-align: center;">More Implications</p> <ul style="list-style-type: none"> • “Simple” models that relate agent behavior to interventions <ul style="list-style-type: none"> – Example: $P\{\text{response}\} = f(\text{agent characteristics, item, intervention})$ • Some intra-agent interactions may be ignorable, especially to start
<p style="text-align: center;">And More ...</p> <ul style="list-style-type: none"> • How to validate agent-based models? <ul style="list-style-type: none"> – Does bias matter if interventions are only being compared? • Can models be simple enough that replication is possible? • Is every survey a special case? <ul style="list-style-type: none"> – There is sobering evidence that there is not a science of data quality. 	<p style="text-align: center;">Some Ugly Questions</p> <ul style="list-style-type: none"> • Is one person’s cost another’s quality? • Shouldn’t quality be measured by inferential uses of the data?
<p style="text-align: center;">The End</p> <ul style="list-style-type: none"> • Thank you • Let’s discuss!
